

Challenge Name: filter fiasco - 100 (WEB)

The image shows a 'Challenge Info' window with a dark theme. On the left, there's a banner with the text 'filter fiasco 100' and a blue button labeled 'Description'. To the right of the banner, it says '136 Solves'. On the right side of the window, under the heading 'Description', there's a paragraph: 'The company's internal authentication system seems simple at first glance, but something doesn't add up. You were given access to their login portal,' followed by a link 'Check Login' and a hint: 'Brute-force attempts won't help here. @localh0ste'. At the bottom right, there's a 'Flag' input field and a button with a speech bubble icon.

The Setup

I was given a simple login page at <http://64.227.171.211:3000/>. The challenge description included the sentence “Brute-force attempts won’t help here,” which suggested the intended solution probably wasn’t a noisy password attack.

When I loaded the page, I saw a minimal login form:

Login

Username:

Password:

No obvious JS or API endpoints from the UI — just a straightforward form.

What I tried

Since brute force was explicitly discouraged, I focused on low-effort, high-payoff checks:

1. Look for weak or default credentials commonly left in dev/test environments.
2. Try common admin defaults before attempting automated attacks.

I entered:

- Username: **admin**
- Password: **admin123**

Result

The credentials worked immediately. The page responded with:

Login

Username:

Password:

Welcome admin! Flag: SPL{27ff7dc84296b8bbec0bf9797df03a12}

Flag captured.

Why this worked

This challenge highlights a common real-world misconfiguration: leaving default credentials in a publicly accessible application. When a challenge explicitly discourages brute force, it often indicates a simpler oversight — in this case, predictable credentials.

Final Notes

A quick, sensible check beat automated attacks here — a good reminder to always try low-effort reconnaissance steps before noisy exploitation.
