

Challenge Name: copy paste - 50 (Threat Intel L1)

Description / Hint from challenge

The challenge states attackers often test or leak credentials on public paste sites, so the expected leak is likely a plaintext credential pair somewhere inside the archive. Because of that explicit hint, searching for common credential keywords (`pass`, `password`, `user`, `login`, etc.) is a logical first step.

Recon / What I saw

- The `copy_paste.zip` contained a file named `server log для deepseek 2` (note the non-ASCII characters).
- I opened that file in a text editor (Notepad) and searched for typical credential keywords (`pass`, `password`, `user`, etc.).

Findings

A search for `pass` revealed a credential pair in plain text:

```
username: student1
password: s3cr3t!
```

Putting those together in the required flag format gives:

Flag: `SPL{student1_s3cr3t!}`
